OBJECTIVE

The objective of this project is to develop an **AI-powered Interview Question Chatbot** that generates **interview questions and ideal answers** based on job descriptions. The chatbot aims to assist **recruiters, hiring managers, and learners** by providing **consistent, fair, and structured interviews** with dynamic conversational capabilities like “*Harder questions*”, “*Behavioral round*”, and “*Coding round*”.

Key Goals:

- 1. Automated Question Generation:**
 - Generate technical, behavioral, and situational interview questions based on the provided job description.
- 2. Dynamic Interaction:**
 - Allow users to request adjustments, such as **increasing question difficulty or switching to behavioral questions**.
- 3. Unbiased and Consistent Evaluation:**
 - Ensure all candidates are asked the same relevant questions, reducing interviewer bias.
- 4. Improved Efficiency:**
 - Save time for recruiters by automating the interview preparation process and providing ready-to-use interview questions.
- 5. Scalability:**
 - Easily adaptable for different roles, industries, and languages, making it a versatile tool for hiring.

Problem Statement

Organizations often struggle to create standardized interview questions across teams.

Interviewers tend to:

- ask inconsistent questions
- repeat basic questions
- miss role-specific competency checks

This leads to:

- bias in evaluation
- poor candidate assessment
- lack of structure in interviews

There is a need for an AI-based conversational system that automatically understands the Job Description and generates relevant interview questions dynamically with expected answers.

Proposed Solution

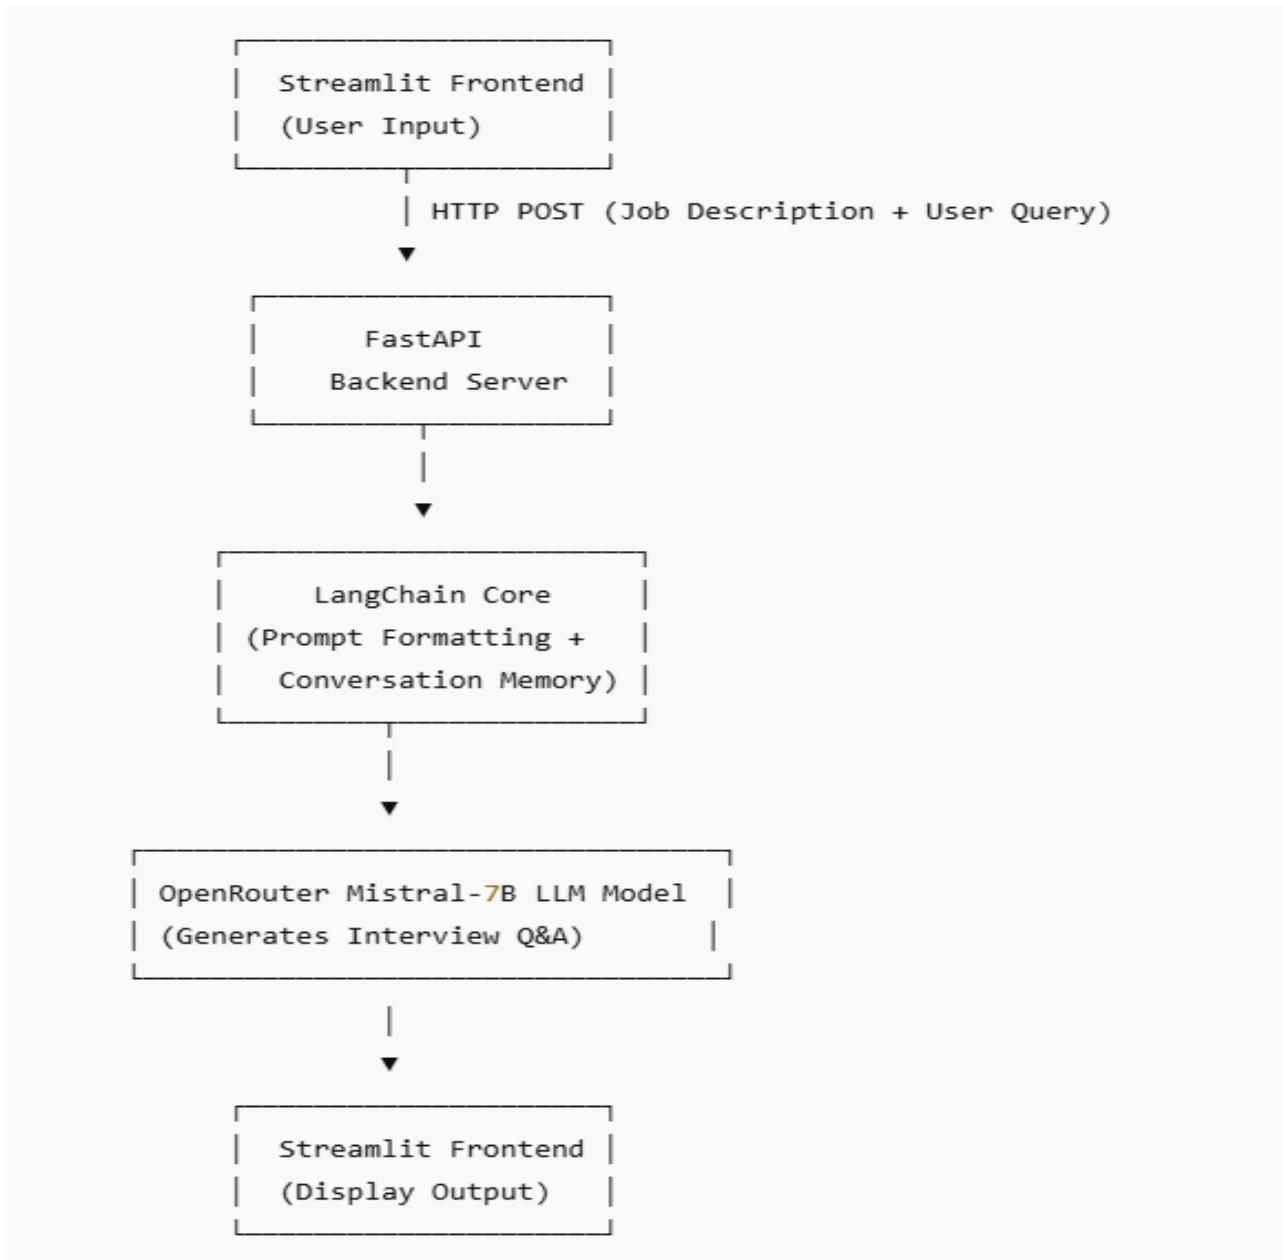

We build an **AI Interview Coach Chatbot** that:

- Takes Job Description as input
- Understands required skills & responsibilities
- Generates relevant **technical, behavioral, and problem-solving questions**
- Responds conversationally and adapts to user instructions
- Maintains memory of previous conversation context

This ensures:

- Interview consistency
- Fair assessment
- Reduced preparation time for recruiters
- Useful practice tool for candidates

System Architecture

Technology Stack

Layer	Technology	Purpose
Frontend UI	Streamlit	Chat interface
Backend API	FastAPI	Communication between UI & model
LLM Wrapper	LangChain	Prompt formatting + memory
Model Provider	OpenRouter + Mistral 7B	Generates questions & answers
Memory Store	ConversationBufferMemory	Maintains chat history
Environment Config	python-dotenv	Secures API key

Features

Feature	Description
Job Description	Tailors questions to the job role
Conversational	User can ask follow-up queries
Multi-Round Support	Technical → Harder → Behavioral → Coding
Memory-Based	Remembers context in the chat
AI-Generated Answers	Provides ideal expected responses for evaluation

CODE

Interview Question Generator
